Introduction

The purpose of this talk is to showcase a new technological enhancement, a look-up feature for reporting medical care providers, added to the Medical Expenditure Panel Survey (MEPS).

Background: MEPS Survey Components

- **MEPS-HC: Household Component**
 - Annual survey of 15,000 households
 - Provides national estimates of health care use, expenditures, insurance coverage, sources of payment, access to care and health care quality
- **MEPS-MPC: Medical Provider Component**
 - Follow-back survey of medical providers linked to respondents of the HC

Background: Medical Provider Component

- Survey of approximately 5,000 hospitals, 12,000 office based providers (OBPs), 7,500 pharmacies, 500 home health care agencies, and 12,000 separately billing doctors linked to respondents of the HC
- *The MPC collects data that household respondents cannot accurately provide, such as dates of visit, charges and payments, diagnosis and procedure codes*
 - ▶ Essential for accuracy of MEPS expenditure estimates

Goals of MEPS-HC enhancements

- Reduce cognitive burden of responding
- Reduce response errors that impede MPC data collection
- Simplify interview administration / reduce survey costs

Provider Look-up Enhancement has...

- Reduce cognitive burden of responding
 - ▶ Google style look-up less burdensome than previous CAPI provider enumeration
 - ▶ One step entry
 - ▶ No required parameters for search - allows respondent to report what they can, in order they prefer
- Reduce response errors that impede MPC data collection
- Simplify interview administration / reduce survey costs

Provider Look-up Enhancement has...

- Reduce cognitive burden of responding
 - ▶ Google style look-up less burdensome than current CAPI provider enumeration
 - ▶ One step entry
 - ▶ No required parameters for search - allows respondent to report what they can, in order they prefer
- Reduce response errors that impede MPC data collection
 - ▶ Fewer opportunities for entry errors
- Simplify interview administration / reduce survey costs

Provider Look-up Enhancement has...

- Reduce cognitive burden of responding
 - ▶ Google style look-up less burdensome than current CAPI provider enumeration.
 - ▶ One step entry; no required parameters for search - allows respondent to report what they can, in order they prefer
- Reduce response errors that impede MPC data collection
 - ▶ Fewer opportunities for entry errors
- Simplify interview administration / reduce survey costs
 - ▶ Interviewer has short list of high likelihood matches to use in interview
 - ▶ Less time required to abstract hand entered providers
 - ▶ Fewer Authorization Forms (AFs), consolidation of MPC requests reduce provider duplication and improve MPC fielding

Provider Look-up Enhancement

- Provider Directory
 - ▶ Free registry of providers with active National Provider Identifier (NPI) maintained by CMS National Plan and Provider Enumeration System (NPPES)
- Provider Look-up
 - ▶ The Blaise system supports a smart search engine called *trigram* search
 - ▶ Google style look-up that matches search string to records in NPI directory in real time

Blaise Trigram Search

- Interviewer types in search string

Blaise Trigram Search

- Interviewer types in search string
- All relevant fields (name, address, phone) for each record in NPI directory concatenated into a single text string (*index*)

Blaise Trigram Search

- Interviewer types in search string
- All relevant fields (name, address, phone) for each record in NPI directory concatenated into a single text string (index)
- Search string and indices are cut into three-character strings called *trigrams* (leading and following spaces added)

Blaise Trigram Search

- Interviewer types in search string
- All relevant fields (name, address, phone) for each record in NPI directory concatenated into a single text string (index)
- Search string and indices are cut into three-character strings called trigrams (leading and following spaces added)
- *Match score* calculated based on how many trigrams from search string are present in the directory indices

Blaise Trigram Search

- Interviewer types in search string
- All relevant fields (name, address, phone) for each record in NPI directory concatenated into a single text string (*index*)
- Search string and indices are cut into three-character strings called trigrams (leading and following spaces added)
- Match score calculated based on how many trigrams from search string are present in the directory indices
- Records with highest match scores above a threshold are displayed

MEPS Specific Enhancements

- Provider Directory
 - ▶ Directory for each interview tailored for respondent
 - ▶ Restricted to providers within a 100-mile radius of respondents zip code
 - ▶ Will add national centers for excellence in the near future
- Provider Look-up
 - ▶ Optimal search heuristics developed by AHRQ and WESTAT and tested by Field Interviewers
 - Start with phone number and/or unique text in provider name; more likely to whittle down to exact match than generic provider name, which may have many erroneous matches

DEMO

- Interface between Blaise CAPI interview and search tool
- Different approaches for search strings, focusing on “unique” information
- Variations in search results

Preliminary results with Look-Up Enhancement

- In prior version of look-up, the “match” rate had dropped to below 60%
- Using the enhanced look-up, we observe a little over an 76% match rate
- Using same approach for looking up Pharmacy providers, we observe a 87% match rate

Applications of Look-up Enhancements

- Could be used for quick search of other large databases, such as ICD10, etc.
 - ▶ Like MEPS, prior information on survey population can help to do further enhancements and refine search/selection process to further reduce burden and time of interview
- Simplifies interviewer training – familiarity with typical search engines (Bing, Google)
 - ▶ Less “new learning”

Conclusion

New provider look-up tool can improve HC and MPC collection:

- Reduce interview burden – Improve interviewers ability to work with respondent to select providers
- NPI directory can result in more accurate provider data
- Better data can streamline MPC data collection
 - ▶ Fewer contact groups, fewer AFs due to less duplication
 - ▶ More accurate/complete/consistent provider address/phone number information reduce amount of contacts to locate a provider
 - ▶ Fewer contacts lower survey costs
- Technology can be generalized to other computer-assisted interviews when a large database is available

Thank you!
